

# Basic Web Dev Setup

## Installs

To get from zero to a working local web page, you need a small set of tools:

### A. Code Editor: VS Code.

Download: <https://code.visualstudio.com/download>

This is where you will write and edit all your code. VS Code also has a built-in terminal.

**Remember:** A code editor is just a text editor built specifically for writing code.

### B. Git

Download: <https://git-scm.com/downloads>

Git saves a history of every change you make to your project, so you can always go back to an earlier version.

### C. A GitHub account.

Sign up: <https://github.com/join>

GitHub is an online home for your Git-tracked projects. Think of it as a backup, and a way to share your work with others (including your teacher).

### D. Choose a tool to talk to GitHub.

Pick whichever feels most comfortable for you. In this course your teacher works with GitHub

Desktop: <https://desktop.github.com/>

It is free, open source, made by GitHub itself. Sign in with your GitHub account. It helps you to move your changes between your computer and GitHub and gives you a visual interface to track your project changes.

### E. Node.js

Download: <https://nodejs.org/> (choose the LTS version)

After installing, check if it worked: in a terminal, type “node -v”. You should see a version number. Then type “npm -v” to see if npm has also been installed (npm comes bundled with Node).
